PROFESSIONAL SUMMARY

Full-Stack Developer | Backend & System Design | AI Automation | Fast Learner

- 3 years shipping production systems end-to-end across MERN, Go, and AI/RAG pipelines.
- Built platforms serving 600+ concurrent users and backend services benchmarked at 1,000 req/sec with a 99.75% success rate.
- Picks up new stacks fast; strong system-design instincts and an independent, high-velocity problem-solving style.

TECHNICAL SKILLS

Languages	JavaScript/TypeScript, Go, Python, C/C++, Java, PHP	Frontend	React.js, Next.js, React Native, HTML, CSS
Backend	Node.js, Express.js, Go, REST APIs, WebSockets, Microservices	Databases	MongoDB, PostgreSQL, SQLite, SQL
Cloud & DevOps	AWS (EC2, S3), Render, Docker, CI/CD	Integrations	Twilio, Google OAuth, Salesforce, WhatsApp Cloud API, Instagram Graph API, Razorpay
Real-Time Systems	Redis, BullMQ, Message Queues, Event-Driven Architecture	AI & Automation	RAG, LangChain, LangGraph, FAISS, n8n, AI Agents
Systems Programming	POSIX APIs, Linux Kernel, QNX RTOS	Tools	Git, Jira, Notion, Postman, Linux

PROFESSIONAL EXPERIENCE

Software Engineer — *Amdrodd Technologies* 2026 – Present

- Building a CRM platform on the MERN stack with integrated communication and workflow automation for end-to-end sales operations.
- Integrated Twilio (messaging), Google OAuth (email workflows), and the Fathom API (meeting insights and call tracking) into the core platform.
- Automated Salesforce data sync and workflow execution through custom backend services.
- Designed AI agents for lead enrichment, profile analysis, and risk prediction using historical data.

MERN Stack Developer — *Datahex Digital Solutions* 2024 – 2026

- Built a School Management System handling mentors, students, finances, and academic workflows for multiple institutions.
- Developed a gamified LMS with live chat, multimedia support, notifications, and payment integrations.
- Contributed to an AI-powered event platform with WhatsApp campaigns, vector search, and recommendation systems.
- Built real-time transcription and translation systems on WebSockets and third-party speech APIs.
- Shipped visa-processing and finance-tracking applications using Node.js and React.
- Built a facial-recognition photo retrieval system and exhibitor dashboards for event platforms.

Software Engineer — *Acsia Technologies* 2023 – 2024

- Optimized QNX RTOS boot time, memory footprint, and CPU performance for embedded automotive systems.
- Developed Adaptive AUTOSAR and AOSP applications; tuned system-level performance.
- Worked on Linux audio drivers, POSIX APIs, and kernel-level programming.

KEY PROJECTS

WhatsApp & Instagram AI Agent Platform

Architected a multi-tenant, multi-platform AI automation suite — web app plus a React Native mobile client — on the Meta WhatsApp Cloud API and Instagram Graph API, with support for custom/pluggable tools and integrations into Notion, Google Calendar, Gmail, and Sheets. Built advanced conversational intelligence: automated follow-ups, hot/cold lead scoring, and automatic human handoff, backed by a RAG pipeline (Gemini + LangChain/LangGraph) for context-aware expense and calendar management. Scaled to 600 concurrent users on a single AWS t4g.micro instance using Redis and BullMQ for asynchronous task processing.

URL Shortener — Go (Backend System-Design Benchmark)

Designed and built a high-throughput URL shortener in Go to stress-test backend system-design fundamentals. Load-tested at 1,000 requests/second over a continuous 5-minute run on a shared AWS t4g.micro instance running other live workloads concurrently, sustaining a 99.75% success rate with no signs of degradation — indicating headroom well beyond the test window. Used Redis for caching, SQLite for persistence, and queue-based request handling for resilience under load.

ERP Platform + E-Commerce Microservices

Built and shipped a production multi-tenant ERP (Node.js, PostgreSQL, React) that automated the company's inventory-to-sales pipeline, GST-compliant accounting, and CRM workflows — directly improving operational efficiency. Extended the platform with microservices that let a single ERP instance centrally manage multiple e-commerce storefronts.

Salesman Route Tracking App

Built a React Native field-force app where admins define and assign geo-routes to salesmen; salesmen check in and mark visits in real time. Integrated with the company ERP for unified sales and route analytics.

WhatsApp Broadcasting System

Real-time bulk messaging engine built on Baileys/WebSockets for large-scale outbound automation workflows.

Knowledge AI System

RAG-based Q&A system using Gemini over structured SQL data for context-aware enterprise knowledge retrieval.

ADDITIONAL PROJECTS

Custom CRM — Lead tracking, communication logging, and sales automation workflows. **Music App** — MERN streaming platform with playlists and search. **Career Portal** — PHP/MySQL job portal with admin and user workflows.

ACHIEVEMENTS

- Organized and conducted a hackathon focused on solving real-world problems.
- 1st Prize — Decipher Hackathon.
- 4th Rank — VAIGA Agri Hackathon (Government of Kerala).
